

Figure 1. The Acoustic Doppler Current Profiler (ADCP) moorings are deployed along two lines, northeast (N1 through N6) and southwest (S1 through S6) of Tsushima Island and in the narrow between the Korea peninsula and Tsushima Island (C1), from May 1999 through March 2000. The 2 stars are points at which the wind stress and its response is examined (Figure 5 and Figure 6).
